Safest way to watch the eclipse

Safety officers warn that although many aluminised mylar 'eclipse viewers' are safe, the best way to avoid lasting damage to the eyes is to use a simple pinhole viewer. The pin hole acts like a miniature camera lens, focusing the sun's rays onto a sheet of white card to create an image of the eclipse

Move pinhole card back and forwards until image is focused

More than 10 million eclipse glasses have been sold in Britain in the past few months

DANGER!

Never view eclipse directly through pinhole, by naked eye, with sunglasses, using camera equipment, exposed film negatives or smoked glass
