

New Icelandic eruption threat to aviation

An Icelandic volcano is threatening to disrupt European air travel again, just a year after the last eruption grounded flights for almost a week. Ash from *Grimsvotn* volcano has created a plume 13km high and is expected to cover a large area of the North Atlantic by Tuesday morning

Mid-Atlantic Ridge: Tectonic plates pulling apart, allowing molten lava to rise to surface

Eyjafjallajökull: Eruption of Apr 14, 2010, caused major disruption, with spasmodic interruption to flights for up to six weeks

Ash cloud prediction, May 24, 00:00GMT
