

North Korea H-bomb test claim

North Korea has announced it has carried out its first hydrogen bomb test. H-bombs use fusion in a chain reaction that results in a far more powerful explosion than the fission blast generated by an atom bomb

Punggye-ri, 01:30GMT: 5.1-magnitude quake detected – similar to three previous atom bomb tests in 2013 (5.1), 2009 (4.5) and 2006 (4.1)
